TESTNG - QUICK GUIDE

http://www.tutorialspoint.com/testng/testng_quick_guide.htm

Copyright © tutorialspoint.com

Testing is the process of checking the functionality of the application whether it is working as per requirements and to ensure that at developer level, unit testing comes into picture. Unit testing is the testing of single entity classormethod. Unit testing is very essential to every software company to give a quality product to their customers.

JUnit has driven developers to understand the usefulness of tests, especially of unit tests when compared to any other testing framework. Leveraging a rather simple, pragmatic, and strict architecture, JUnit has been able to "infect" great number of developers. Features of JUnit can be seen in Junit Features.

Some of the short comings of JUnit are:

Initially designed to enable unit testing only, now used for all kinds of testing. Cannot do

- dependency testing.
- Poor configuration control setUp/tearDown.
- Intrusive forcesyoutoextendclassesandnameyourmethodsacertainway. Static
- programming model forcesyoutorecompileunnecessarily.
- The management of different suites of tests in complex projects can be very tricky...

What is TestNG?

Definition of TestNG asper its documentation is:

TestNG is a testing framework inspired from JUnit and NUnit but introducing some new functionalities that make it more powerful and easier to use.

TestNG is an open source automated testing framework; where NG of TestNG means Next Generation. TestNG is similar to JUnit especially JUnit4, but its not a JUnit extension. Its inspired by JUnit. It is designed to be better than JUnit, especially when testing integrated classes. The creator of TestNG is Cedric Beust.

TestNG eliminates most of the limitations of the older framework and gives the developer the ability to write more flexible and powerful tests. As it heavily borrows from Java Annotations introducedwith JDK5.0 to define tests, it can also show you how to use this new feature of the Java language in a real production environment.

TestNG Features

- Annotations.
- TestNG uses more Java and OO features.
- Supports testing integrated classes e.g., bydefault, noneedtocreateanewtestclassinstanceforeverytestmethod.
- Separate compile-time test code from run-time configuration/data info.
- Flexible runtime configuration.
- Introduces 'test groups'. Once you have compiled your tests, you can just ask TestNG to run all the "front-end" tests, or "fast", "slow", "database", etc...
- Supports Dependent test methods, parallel testing, load testing, partial failure. Flexible
- plug-in API.
- Support for multi threaded testing.

ENVIRONMENT SET-UP

TestNG is a framework for Java, so the very first requirement is to have JDK installed in your machine.

System Requirement

JDK	1.5 or above.
Memory Disk	no minimum requirement. no
Space	minimum requirement. no
Operating System	minimum requirement.

Step 1 - verify Java installation in your machine

Now, open console and execute the following java command.

os	Task	Command
Windows	Open Command Console	c:\> java -version
Linux	Open Command Terminal	\$ java -version
Mac	Open Terminal	machine:~ joseph\$ java -version

Let's verify the output for all the operating systems:

os	Output
Windows	java version "1.7.0_25" Java TM SE Runtime Environment $build$ 1.7.0 $_2$ 5 – b 15 Java HotSpot TM 64-Bit Server VM $build$ 23.25 – b 01, $mixedmode$
Linux	java version "1.7.0_25" Java TM SE Runtime Environment $build$ 1.7.0 $_2$ 5 – b 15 Java HotSpot TM 64-Bit Server VM $build$ 23.25 – b 01, $mixed mode$
Mac	java version "1.7.0_25" Java TM SE Runtime Environment $build$ 1.7.0 $_2$ 5 – b 15 Java HotSpot TM 64-Bit Server VM $build$ 23.25 – b 01, $mixedmode$

If you do not have Java installed, install the Java Software Development Kit *SDK* from http://www.oracle.com/technetwork/java/javase/downloads/index.html. We are assuming Java 1.7.0_25 as installed version for this tutorial.

Step 2: Set JAVA environment

Set the **JAVA_HOME** environment variable to point to the base directory location, where Java is installed on your machine. For example;

os	Output
Windows	Set the environment variable JAVA_HOME to C:\Program Files\Java\jdk1.7.0_25

Linux export JAVA HOME=/usr/local/java-current

Mac export JAVA HOME=/Library/Java/Home

Append Java compiler location to System Path.

os	Output
Windows	Append the string ;C:\Program Files\Java\jdk1.7.0_25\bin to the end of the system variable, Path.
Linux	export PATH=PATH: JAVA_HOME/bin/
Mac	not required

Verify Java Installation using java -version command explained above.

Step 3: Download TestNG archive

Download latest version of TestNG jar file from http://www.testng.org. At the time of writing this tutorial, I downloaded testng-6.8.jar and copied it into C:\>TestNG folder.

os	Archive name
Windows	testng-6.8.jar
Linux	testng-6.8.jar
Mac	testng-6.8.jar

Step 4: Set TestNG environment

Set the **TESTNG_HOME** environment variable to point to the base directory location, where TestNG jar is stored on your machine. Assuming, we've stored testng-6.8.jar in TestNG folder on various Operating Systems as follows.

os	Output
Windows	Set the environment variable TESTNG_HOME to C:\TESTNG
Linux	export TESTNG_HOME=/usr/local/TESTNG
Mac	export TESTNG_HOME=/Library/TESTNG

Step 5: Set CLASSPATH variable

Set the **CLASSPATH** environment variable to point to the TestNG jar location. Assuming, we've stored testng-6.8.jar in TestNG folder on various Operating Systems as follows.

os	Output
Windows	Set the environment variable CLASSPATH to %CLASSPATH%;%TESTNG_HOME%\testng-6.8.jar;
Linux	export CLASSPATH=CLASSPATH:TESTNG_HOME/testng-6.8.jar:

Step 6: Test TestNG Setup

Create a java class file name TestNGSimpleTest in C:\ > TestNG_WORKSPACE

```
import org. testng. annotations. Test;
import static org. testng. Assert. assertEquals;

public class TestNGSimpleTest { @Test
   public void testAdd() {
    String str = "TestNG is working fine"; assertEquals("TestNG
    is working fine", str);
}
```

TestNG can be invoked in several different ways: With

- · a testng.xml file
- With ant
- From the command line

Let us invoke using the testng.xml file. Create an xml file with name testng.xml in C:\>
TestNG_WORKSPACE to execute Test cases.

Step 7: Verify the Result

Compile the class using **javac**compiler as follows:

```
C:\textrustriangleright C:\textra{TestNG_WORKSPACE} \textrustriangleright java
```

Now, invoke the testng.xml to see the result.

```
C:\forall TestNG_WORKSPACE\forall java -cp "C:\forall TestNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output.

WRITING TESTS

Writing a test in TestNG basically involves following steps:

- Write the business logic of your test and insert TestNG annotations in your code.
- Add the information about your test e. g. theclassname, the group syouw is htorun, etc. . . in a testing.xml

file or in build.xml..

Run TestNG.

Here, we will see one complete example of TestNG testing using POJO class, Business logic class and a test xml, which will be run by TestNG.

Create EmployeeDetails.javain C:\ > TestNG_WORKSPACE which is a POJO class.

```
public class EmployeeDetails {
   private String name;
   private double monthlySalary; private
   int age;
   /**
   * @return the name
   public String getName() { return
       name;
   }
    /**
   * @ param name the name to set
   public void setName(String name) { this.name =
       name;
   /**
   * @return the monthlySalary
   public double getMonthlySalary() { return
       monthlySalary;
   /**
   * @ param monthlySalary the monthlySalary to set
   public void setMonthlySalary(double monthlySalary) {
       this. monthlySalary = monthlySalary;
   /**
   * @return the age
   */
   public int getAge() {
       return age;
   /**
   * @ param age the age to set
   public void setAge(int age) {
    this.age = age;
```

EmployeeDetails class is used to:

get/set the value of employee's name.

get/set the value of employee's monthly salary. get/set the

value of employee's age.

Create a EmpBusinessLogic.java in C:\ > TestNG_WORKSPACE which contains business logic.

```
public class EmpBusinessLogic {
    // Calculate the yearly salary of employee
    public double calculateYearlySalary(EmployeeDetails employeeDetails) { double
        yearlySalary=0;
        yearlySalary = employeeDetails.getMonthlySalary() * 12;
```

```
return yearlySalary;
}

// Calculate the appraisal amount of employee
public double calculateAppraisal(EmployeeDetails employeeDetails) { double
    appraisal=0;
    if (employeeDetails.getMonthlySalary() < 10000) {
        appraisal = 500;
    }else {
        appraisal = 1000;
    }
    return appraisal;
}</pre>
```

EmpBusinessLogic class is used for calculating. the

yearly salary of employee.

the appraisal amount of employee.

Now, let's create a TestNG class called **TestEmployeeDetails.java** in **C:\ > TestNG_WORKSPACE**.A TestNG class is a Java class that contains at least one TestNG annotation. This class contains test cases to be tested. A TestNG test can be configured by @BeforeXXX and @AfterXXX annotations (we will see this in the chapter <u>TestNG - Execution Procedure</u>) which allows to perform some Java logic before and after a certain point.

Text to PDF Converter - Convert Text to PDF for Free

Drag a text file into the PDF converter.

The conversion will pick up as soon as the file is uploaded.

On the following page, modify the PDF as needed.

Otherwise, click 'Download' to save the new PDF file.

```
import org. testng. Assert;
import org. testng. annotations. Test;
public class TestEmployeeDetails {
EmpBusinessLogic empBusinessLogic = new EmpBusinessLogic();
EmployeeDetails employee = new EmployeeDetails();
 @Test
 public void testCalculateAppriasal() {
  employee. setName ("Rajeev");
  employee. setAge (25);
  employee. setMonthlySalary (8000); double
  appraisal = empBusinessLogic
   .calculateAppraisal(employee); Assert.assertEquals(500,
  appraisal, 0.0, "500");
// test to check yearly salary @Test
 public void testCalculateYearlySalary() {
  employee. setName ("Rajeev"); employee. setAge (25);
  employee. setMonthlySalary (8000);
  double salary = empBusinessLogic
   .calculateYearlySalary(employee);
  Assert. assertEquals (96000, salary, 0.0, "8000");
```

TestEmployeeDetails class is used for testing the methods of **EmpBusinessLogic** class. It tests the yearly salary of the employee.

tests the appraisal amount of the employee.

Before you can run the tests, however, you must configure TestNG using a special XML file, conventionally named testng.xml. The syntax for this file is very simple, and its contents as below. Create this file in C:\> TestNG_WORKSPACE:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE suite SYSTEM "http://testng.org/testng-1.0.dtd" >
```

- •
- •

•

•

Details of the above file are as below:

- A suite is represented by one XML file. It can contain one or more tests and is defined by the <suite> tag.
- Tag <test> represents one test and can contain one or more TestNG classes.
- <class> tag represents a TestNG class is a Java class that contains at least one TestNG annotation. It can contain one or more test methods.

Compile the Test case classes using javac.

```
C:\footnote{TestNG_WORKSPACE} javacEmployeeDetails.javaEmpBusinessLogic.java TestEmployeeDetails.java
```

Now TestNG with the following command:

```
C:\forall TestNG_WORKSPACE\forall java -cp "C:\forall TestNG_WORKSPACE" org. testng. TestNG testng. xml
```

If all has been done correctly, you should see the results of your tests in the console. Furthermore, TestNG creates a very nice HTML report in a folder called **test-output** that is automatically created in the current directory. If you open it and load index.html, you will see a page similar to the one in the image below:

BASIC ANNOTATIONS

The traditional way to indicate test methods in JUnit 3 is by prefixing their name with test. This is a very effective method for tagging certain methods in a class as having a special meaning, but the naming doesn't scale very well whatifwewanttoaddmoretagsfordifferentframeworks? and is rather inflexible whatifwewanttopassadditionalparameterstothetestingframework?.

Annotations were formally added to the Java language in JDK 5 and TestNG made the choice to use annotations to annotate test classes.

Here is the list of annotations that TestNG supports:

Annotation	Description
@BeforeSuite	The annotated method will be run only once before all tests in this suite have run.
@AfterSuite	The annotated method will be run only once after all tests in this suite have run.
@BeforeClass	The annotated method will be run only once before the first test method in the current class is invoked.

@AfterClass
The annotated method will be run only once after all the test methods in the current

class have been run.

@BeforeTest
The annotated method will be run before any test method belonging to the classes

inside the <test> tag is run.

@AfterTest The annotated method will be run after all the test methods belonging to the

classes inside the <test> tag have run.

@BeforeGroups The list of groups that this configuration method will run before. This method is

guaranteed to run shortly before the first test method that belongs to any of

these groups is invoked.

@AfterGroups The list of groups that this configuration method will run after. This method is

guaranteed to run shortly after the last test method that belongs to any of these groups

is invoked.

@BeforeMethod The annotated method will be run before each testmethod.

@AfterMethod The annotated method will be run after each testmethod.

@DataProvider Marks a method as supplying data for a test method. The annotated method must

return an Object[][] where each Object[] can be assigned the parameter list of the test method. The @Test method that wants to receive data from this DataProvider needs

to use a dataProvider name equals to the name of this annotation.

@Factory Marks a method as a factory that returns objects that will be used by TestNG as Test

classes. The method must return Object[].

@Listeners Defines listeners on a testclass.

@Parameters Describes how to pass parameters to a @Test method.

@Test Marks a class or a method as part of the test.

Benefits of using annotations

Following are some of the benefits of using annotations:

- TestNG identifies the methods it is interested in by looking up annotations. Hence method names are not restricted to any pattern or format.
- We can pass additional parameters to annotations.
- Annotations are strongly typed, so the compiler will flag any mistakes right away. Test classes
- no longer need to extend anything *suchasTestCase*, *forJUnit3*.

EXCECUTION PROCEDURE

This tutorial explains the execution procedure of methods in TestNG which means that which method is called first and which one after that. Here is the execution procedure of the TestNG test API methods with the example.

Create a java class file name TestngAnnotation.java in C:\ > TestNG WORKSPACE to test annotation.

```
import org. testng. annotations. Test;
import org. testng. annotations. BeforeMethod; import
org. testng. annotations. AfterMethod; import
org. testng. annotations. BeforeClass; import
org. testng. annotations. AfterClass; import
org. testng. annotations. BeforeTest;
```

```
import org. testng. annotations. AfterTest; import
org. testng. annotations. BeforeSuite; import
org. testng. annotations. AfterSuite;
public class TestngAnnotation {
// test case 1 @
 Test
 public void testCase1() {
  System. out. println("in test case1");
 // test case 2 @
 Test
 public void testCase2() {
  System. out. println("in test case 2");
 @BeforeMethod
 public void beforeMethod() { System. out. println("in
  beforeMethod");
 @AfterMethod
 public void afterMethod() {
  System. out. println("in afterMethod");
 @BeforeClass
 public void beforeClass() {
  System. out. println("inbeforeClass");
 @AfterClass
 public void afterClass() {
  System. out. println("in afterClass");
 @BeforeTest
 public void beforeTest() {
  System. out. println("inbeforeTest");
 @AfterTest
 public void afterTest() {
  System. out. println("in afterTest");
 @BeforeSuite
 public void beforeSuite() {
  System.out.println("in beforeSuite");
 @AfterSuite
 public void afterSuite() {
  System. out. println("inafterSuite");
```

Next, let's create the file **testng.xml** in **C:\ > TestNG_WORKSPACE** to execute annotations.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE suite SYSTEM "http://testng.org/testng-1.0.dtd" >
<suitename="Suite1">
  <test name="test1">
    <classes>
        <class name="TestngAnnotation"/>
    </classes>
  </test>
```

```
</suite>
```

Compile the Test case class using javac.

```
C:\forall TestNG_WORKSPACE > javac TestngAnnotation. java
```

Now, run the testng.xml, which will run test case defined in provided Test Case class.

```
C:\forall TestNG_WORKSPACE>java org. testng. TestNG testng. xml
```

Verify the output.

See the above output and this is how the TestNG execution procedure is: First of all

- beforeSuite method is executed only once.
- Lastly, the afterSuite method executes only once.
- Even the methods beforeTest, beforeClass, afterClass and afterTest methods are executed only once.
- beforeMethod method executes for each test case but before executing the test case. afterMethod
- method executes for each test case but after the execution of test case. In between beforeMethod
- and afterMethod each test case executes.

EXECUTING TESTS

The test cases are executed using **TestNG** class. This class is the main entry point for running tests in the TestNG framework. Users can create their own TestNG object and invoke it in many different ways:

- On an existing testng.xml
- On a synthetic testing.xml, created entirely from Java By
- directly setting the test classes.

You can also define which groups to include or exclude, assign parameters, etc. The command line parameters are:

- -d outputdir: specify the output directory
- -testclass class_name: specifies one or several class names
- · -testjar jar_name: specifies the jar containing the tests

```
-sourcedir src1;src2: ; separated list of source directories usedonlywhenjavadocannotationsareused
-target
-groups
-testrunfactory
```

We will create the TestNG object an existing testng.xml in our example below.

Create a Class

-listener

Create a java class to be tested say MessageUtil.java in C:\ > TestNG_WORKSPACE

```
/*
 * This class prints the given message on console.
 */
public class MessageUtil { private

    String message:
    //Constructor
    //@ param message to be printed public
    MessageUtil(Stringmessage) {
        this.message = message;
    }

    // prints the message
    public String printMessage() {
        System.out.println(message); return
        message;
    }
}
```

Create Test Case Class

Create a java test class say SampleTest.java.

Add a test method testPrintMessage to your test class. Add an

Annotation @Test to method testPrintMessage.

Implement the test condition and check the condition using assertEquals API of TestNG.

Create a java class file name SampleTest.java in C:\ > TestNG_WORKSPACE

Create testng.xml
Next, let's create testng.xml file in C:\ > TestNG_WORKSPACE to execute Test cases. This file captures your entire testing in XML. This file makes it easy to describe all your test suites and their parameters in one file, which you can check in your code repository or email to coworkers. It also
•
•
•
•

Ĭ

makes it easy to extract subsets of your tests or split several runtime configurations *e. g.*, *testng – database. xmlwouldrunonlyteststhatexerciseyourdatabase*.

Compile the Test case using javac.

```
C:\textRestNG_WORKSPACE>javac MessageUtil.java SampleTest.java
```

Now, run the testng.xml, which will run test case defined in <test> tag.

```
C:\forall TestNG_WORKSPACE\forall java -cp "C:\forall TestNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output.

SUITE TESTS

A **Test suite** is a collection of test cases that are intended to test a behavior or set of behaviors of software program. In TestNG, we cannot define a suite in testing source code, but it is represented by one XML file as suite is the feature of execution. This also allows flexible configuration of the *tests* to be run. A suite can contain one or more tests and is defined by the <suite> tag.

<suite> is a root tag of your testng.xml. It describes a test suite, which in turn is made of several <test> sections.

Table below lists all the legal attributes <suite> accepts.

Attribute	Description
name	The name of this suite. It is a mandatory attribute.
verbose	The level or verbosity for this run.
parallel	Whether TestNG should run different threads to run this suite.
thread-count	The number of threads to use, if parallel mode is enabled <i>ignoredother-wise</i> .
annotations	The type of annotations you are using in yourtests.
time-out	The default timeout that will be used on all the test methods found in this test.

In this chapter we will show you an example having two Test1 & Test2 test classes to run together using Test Suite.

Create a Class

Create a java class to be tested say MessageUtil.java in C:\ > JUNIT_WORKSPACE

```
* This class prints the given message on console.
public class MessageUtil { private
    String message;
    // Constructor
     // @ param message to be printed public
     MessageUtil(String message) {
      this.message = message;
     // prints the message
     public String printMessage() {
      System. out. println(message); return
      message;
     // add "Hi!" to the message
     public String salutationMessage() {
      message = "Hi!" + message;
      System. out. println (message); return
      message;
```

Create Test Case Classes

Create a java class file name Test1.java in C:\ > TestNG_WORKSPACE

```
import org.testng.Assert;
import org.testng.annotations.Test;

public class Test1 {
    String message = "Manisha";
    MessageUtil messageUtil = new MessageUtil(message);

@Test
    public void testPrintMessage() { System.out.println("Inside testPrintMessage()");
    Assert.assertEquals(message, messageUtil.printMessage());
    }
}
```

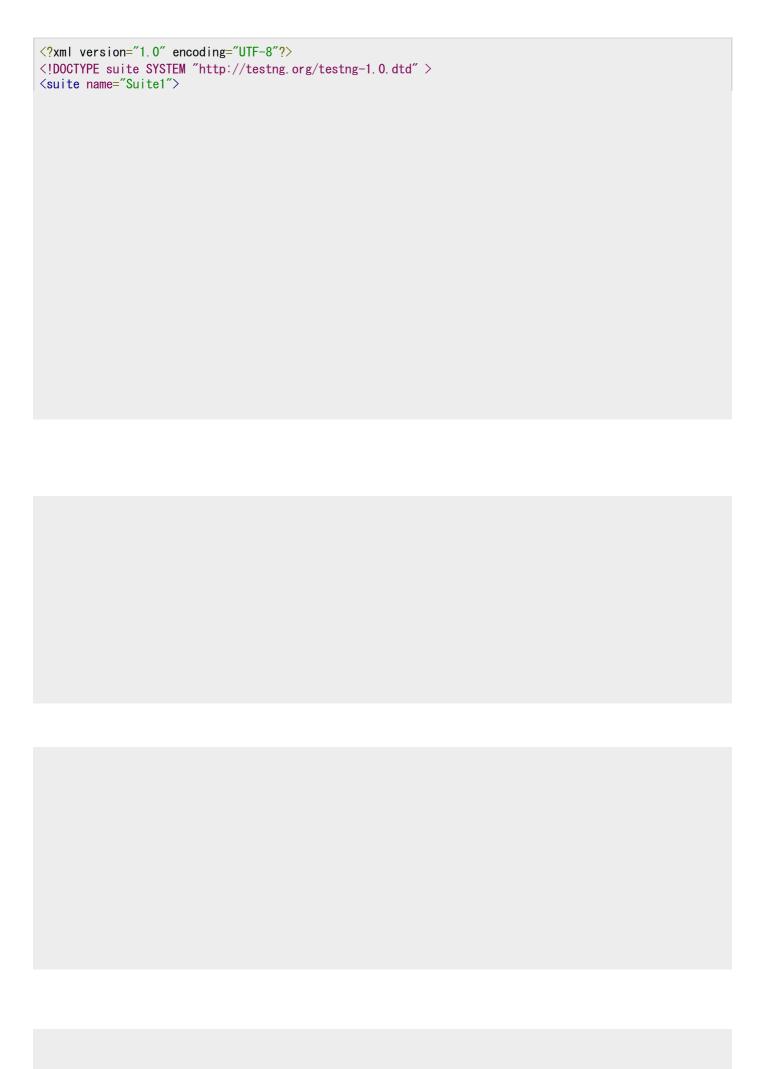

Create a java class file name Test2.java in C:\ > TestNG_WORKSPACE

```
import org. testng. Assert;
import org. testng. annotations. Test;

public class Test2 {
    String message = "Manisha";
    MessageUtil messageUtil = new MessageUtil(message);

@Test
    public void testSalutationMessage() { System.out.println("Inside testSalutationMessage()"); message = "Hi!" + "Manisha";
        Assert. assertEquals(message, messageUtil.salutationMessage());
    }
}
```

Now, let's write the testng.xml in C:\ > TestNG_WORKSPACE which would contain the <suite> tag as follows:

Suite1 includes exampletest1 and exampletest2. Compile all

java classes using javac.

```
C:\forall TestNG_WORKSPACE > javac MessageUtil. java Test1. java Test2. java
```

Now, run the testng.xml, which will run test case defined in provided Test Case class.

```
C:\testNG_WORKSPACE>java -cp "C:\testNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output.

IGNORE TESTS

Sometimes, it happens that our code is not ready and test case written to test that method/code will fail if run. In such cases annotation @Testenabled = false helps to disable this test case.

A test method annotated with @Testenabled = false, then the test case that is not ready to test is bypassed.

Now, let's see @Testenabled = false in action.

Create a Class

Create a java class to be tested say MessageUtil.java in C:\ > TestNG_WORKSPACE

```
/*
 * This class prints the given message on console.
 */
public class MessageUtil { private

    String message;

    //Constructor
    //@ param message to be printed public
    MessageUtil(Stringmessage) {
        this.message = message;
    }

    // prints the message
    public String printMessage() {
        System. out. println(message); return
        message;
}
```

```
// add "Hi!" to the message public
String salutationMessage() {
    message = "Hi!" + message;
    System. out. println(message); return
    message;
}
```

Create Test Case Class

Create a java test class say IgnoreTest.java.

Add test methods testPrintMessage, testSalutationMessage to your test class. Add an

Annotation @Test*enabled* = *false* to method testPrintMessage.

Create a java class file name IgnoreTest.java in C:\ > TestNG_WORKSPACE

```
import org. testng. Assert;
import org. testng. annotations. Test;

public class IgnoreTest { String
    message = "Manisha";
    MessageUtil messageUtil = new MessageUtil(message);

    @Test(enabled = false)
    public void testPrintMessage() { System. out. println("Inside testPrintMessage()"); message = "Manisha";

Assert. assertEquals(message, messageUtil. printMessage());
}

    @Test
    public void testSalutationMessage() { System. out. println("Inside testSalutationMessage()");
    message = "Hi!" + "Manisha";
    Assert. assertEquals(message, messageUtil. salutationMessage());
}
```

Create testng.xml

Create a testng.xml C:\ > TestNG_WORKSPACE to execute Test cases

Compile the MessageUtil, Test case classes using javac.

```
C:\textractions | C:\textraction | C:\te
```

Now, run the testng.xml, which will not run testPrintMessage test case defined in provided Test Case class.

```
C:\testNG_WORKSPACE>java -cp "C:\testNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output. testPrintMessage test case is not tested.

GROUP TEST

The group test is a new innovative feature in TestNG, it doesn't exist in JUnit framework, it permits you dispatch methods into proper portions and preform sophisticated groupings of test methods. Not only can you declare those methods that belong to groups, but you can also specify groups that contain other groups. Then, TestNG can be invoked and asked to include a certain set of groups *orregularexpressions* while excluding another set. This gives you maximum flexibility in how you partition your tests and doesn't require you to recompile anything if you want to run two different sets of tests back toback.

Groups are specified in your testng.xml file using the <groups> tag. It can be found either under the <test> or <suite> tag. Groups specified in the <suite> tag apply to all the <test> tags underneath.

Now, let's see an example of how to group test.

Create a Class

Create a java class to be tested say MessageUtil.java in C:\ > TestNG_WORKSPACE

```
* This class prints the given message on console.
public class MessageUtil { private
    String message:
     // Constructor
     // @ param message to be printed public
     MessageUtil(String message) {
          this.message = message;
     // prints the message
     public String printMessage() {
         System. out. println(message);
 return message;
     // add "tutorialspoint" to the message public
     String salutationMessage() {
         message = "tutorialspoint" +message;
 System. out. println (message);
 return message;
    // add "www." to the message
    public String exitMessage() {
 message = "www." + message;
 System. out. println (message);
 return message;
```

Create Test Case	Class		
Create a java tes	st class say GroupTestEx	kample.java.	
•			

Add test methods testPrintMessage, testSalutationMessage to your test class. Group

the test method in two categories say:

Check-in tests *checkintest*: These tests should be run before you submit new code. They should typically be fast and just make sure no basic functionality is broken.

Functional tests *functest*: These tests should cover all the functionalities of your software and be run at least once a day, although ideally you would want to run them continuously.

Create the java class file name GroupTestExample.java in C:\ > TestNG_WORKSPACE

```
import org. testng. Assert;
import org. testng. annotations. Test;
public class GroupTestExample {
     String message = ".com";
     MessageUtil messageUtil = new MessageUtil(message);
     @Test(groups = { "functest", "checkintest" }) public
     void testPrintMessage() {
          System. out. println("Inside testPrintMessage()"); message
Assert. assertEquals (message, messageUtil.printMessage());
     @ Test(groups = { "checkintest" }) public
     void testSalutationMessage() {
          System. out. println("Inside testSalutationMessage()"); message =
 "tutorialspoint" + ".com"; Assert.assertEquals(message,
messageUtil.salutationMessage());
     @ Test(groups = { "functest" }) public
     void testingExitMessage() {
          System. out. println("Inside testExitMessage()"); message =
          "www." + "tutorialspoint"+".com";
Assert. assertEquals (message, messageUtil.exitMessage());
```

Create testng.xml

Create a testng.xml C:\ > TestNG_WORKSPACE to execute Test cases. Here, we would be executing only those tests which belong to the group *functest*.

Compile the MessageUtil, Test case classes using javac.

C:\textractions Testing_WORKSPACE>javac MessageUtil.java GroupTestExample.java					
Now, run the testng.xml, which will run only the method testPrintMessage as it belongs to the group o					
0					

```
C:\testNG_WORKSPACE>java -cp "C:\testNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output. Only the method testPrintMessage is executed.

Groups of groups

Groups can also include other groups. These groups are called *MetaGroups*. For example, you might want to define a group *all* that includes *checkintest* and *functest*. Let's modify our testng.xml file as below:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE suite SYSTEM "http://testng.org/testng-1.0.dtd" >
<suite name="Suite1">
   <test name="test1">
       <groups>
           <define name="all">
      <include name="functest"/>
      <include name="checkintest"/>
  </define>
  <run>
      <include name="all"/>
  </run>
      </groups>
  <classes>
        <class name="GroupTestExample" />
 </classes>
   </test>
</suite>
```

Executing the above testng.xml will execute all the three tests and will give you the below result:

Exclusion groups

You can ignore a group by using the <exclude> tag as shown below:

EXCEPTION TEST

TestNG provides a option of tracing the Exception handling of code. You can test whether a code throws desired exception or not. The **expectedExceptions** parameter is used along with @Test annotation. Now let's see @TestexpectedExceptions in action.

Create a Class

- Create a java class to be tested say MessageUtil.java in C:\ > TestNG_WORKSPACE. Add a error
- condition inside printMessage method.

```
* This class prints the given message on console.
public class MessageUtil { private
   String message;
   //Constructor
   //@ param message to be printed public
   MessageUtil(Stringmessage) {
       this.message = message;
   // prints the message public
   void printMessage() {
       System. out. println(message); int a
       =0:
       int b = 1/a;
   }
   // add "Hi!" to the message public
   String salutationMessage () {
       message = "Hi!" + message;
       System. out. println(message); return
       message;
```

Create Test Case Class

- Create a java test class say ExpectedExceptionTest.java.
- Add expected exception ArithmeticException to testPrintMessage test case.

Create a java class file name ExpectedExceptionTest.java in C:\ > TestNG_WORKSPACE

```
import org. testng. Assert;
import org. testng. annotations. Test;

public class ExpectedExceptionTest { String
    message = "Manisha";
    MessageUtil messageUtil = new MessageUtil(message);
```

```
@Test(expectedExceptions = ArithmeticException.class) public void
testPrintMessage() {
        System.out.println("Inside testPrintMessage()");
        messageUtil.printMessage();
}
@Test
public void testSalutationMessage() { System.out.println("Inside
        testSalutationMessage()"); message = "Hi!" + "Manisha";
        Assert.assertEquals(message, messageUtil.salutationMessage());
}
```

Create Test Runner

Create a testing.xml in C:\ > TestNG_WORKSPACE to execute Test cases.

Compile the MessageUtil, Test case classes using javac

```
C:\forall TestNG_WORKSPACE > javac MessageUtil. java TestJunit. java
```

Now, run the Test Runner which will run test cases defined in provided Test Case class.

```
C:\testNG_WORKSPACE>java -cp "C:\testNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output. testPrintMessage test case will be passed.

DEPENDENCY TEST

Sometimes, you may need to invoke methods in a Test case in a particular order or you want to share some data and state between methods. This kind of dependency is supported by TestNG as i supports the declaration of explicit dependencies between test methods.

TestNG allows you to specify dependencies either with:

 Using attributes dependsOnMethods in @Test annotations OR Using attributes dependsOnGroups in @Test annotations.

Example using attribute dependsOnMethods

Create a Class

Create a java class to be tested say MessageUtil.java in C:\ > TestNG WORKSPACE

```
public class MessageUtil { private
    String message:

    // Constructor
    // @ param message to be printed public
    MessageUtil (String message) {
        this.message = message;
    }

    // prints the message
    public String printMessage() {
        System.out.println(message);
    return message;
    }

    // add "Hi!" to the message
    public String salutationMessage() {
    message = "Hi!" + message;
    System.out.println(message);
    return message:
    }
}
```

Create Test Case Class

- Create a java test class say DependencyTestUsingAnnotation.java.
- Add test methods testPrintMessage,testSalutationMessage and initEnvironmentTest to your test class.
- Add attribute dependsOnMethods = { "initEnvironmentTest" } to the @Test annotation of testSalutationMessage method.

Create the java class file name DependencyTestUsingAnnotation.java in C:\ > TestNG WORKSPACE

```
import org. testng. Assert;
import org. testng. annotations. Test;
public class DependencyTestUsingAnnotation { String
    message = "Manisha";
     MessageUtil messageUtil = new MessageUtil(message);
    @Test
    public void testPrintMessage() {
 System. out. println("Inside testPrintMessage()"); message
 = "Manisha";
 Assert. assertEquals (message, messageUtil.printMessage());
    @Test (dependsOnMethods = { "initEnvironmentTest" }) public
     void testSalutationMessage() {
         System.out.println("Inside testSalutationMessage()"); message =
 "Hi!" + "Manisha";
 Assert. assertEquals (message, messageUtil. salutationMessage());
    @Test
     public void initEnvironmentTest() {
 System. out. println("This is initEnvironmentTest");
```

Create testng.xml

Compile the MessageUtil, Test case classes using javac.

```
C:\textrustrestNG_WORKSPACE>javac MessageUtil.java DependencyTestUsingAnnotation.java
```

Now, run the testng.xml, which will run the testSalutationMessage method only after the execution of initEnvironmentTest method.

```
\texttt{C:} \verb|YTestNG_WORKSPACE|| java -cp "C:} \verb|YTestNG_WORKSPACE|| org. testng. TestNG testng. xml|| xml| statement of the sta
```

Verify the output.

```
This isinitEnvironmentTest Inside
testPrintMessage() Manisha
Inside testSalutationMessage()
Hi!Manisha

Suite1
Total tests run: 3, Failures: 0, Skips: 0
```

Example using attribute dependsOnGroups

You can also have methods that depend on entire groups. Let's see an example below:

Create a Class

Create a java class to be tested say MessageUtil.java in C:\ > TestNG_WORKSPACE

```
public class MessageUtil { private
    String message:

    // Constructor
    // @ param message to be printed public
    MessageUtil(String message) {
        this.message = message;
    }

    // prints the message
    public String printMessage() {
        System.out.println(message);
    return message;
    }

    // add "Hi!" to the message
    public String salutationMessage() {
    message = "Hi!" + message;
    System.out.println(message);
    return message:
    }
}
```

Create Test Case Class		

Create a java test class say DependencyTestUsingAnnotation.java.

Add test methods testPrintMessage,testSalutationMessage and initEnvironmentTest to your test class and them to the group "init".

Add attribute *dependsOnMethods* = { "init.*" } to the @Test annotation of *testSalutationMessage* method.

Create the java class file name DependencyTestUsingAnnotation.java in C:\ > TestNG_WORKSPACE

```
import org. testng. Assert;
import org. testng. annotations. Test;
public class DependencyTestUsingAnnotation { String
     message = "Manisha";
     MessageUtil messageUtil = new MessageUtil(message);
     @ Test(groups = { "init" }) public
     void testPrintMessage() {
 System. out. println("Inside testPrintMessage()"); message
 = "Manisha":
Assert.assertEquals(message, messageUtil.printMessage());
     @Test(dependsOnGroups = { "init.*" }) public
     void testSalutationMessage() {
 System.out.println("Inside testSalutationMessage()"); message = "Hi!"
 + "Manisha";
Assert. assertEquals (message, messageUtil. salutationMessage());
     @Test(groups = { "init" })
     public void initEnvironmentTest() {
System. out. println("This is initEnvironmentTest");
```

In this example, testSalutationMessage is declared as depending on any group matching the regular expression "init.*", which guarantees that the methods testPrintMessage and initEnvironmentTest will always be invoked before testSalutationMessage.

If a method depended upon fails and you have a hard dependency on it alwaysRun = false, whichisthedefault, the methods that depend on it are not marked as FAIL but as SKIP. Skipped methods will be reported as such in the final report inacolorthatisneitherrednorgreeninHTML, which is important since skipped methods are not necessarily failures.

Create testng.xml

Create a testing.xml C:\ > TestNG_WORKSPACE to execute Test cases.

Compile the MessageUtil, Test case classes using javac.					
•					

```
C:\footnote{TestNG WORKSPACE} javac MessageUtil. java DependencyTestUsingAnnotation. java
```

Now, run the testng.xml, which will run the testSalutationMessage method only after the execution of initEnvironmentTest method.

```
C:\foothig_WORKSPACE\java -cp "C:\foothig_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output.

```
This is initEnvironmentTest Inside
testPrintMessage() Manisha
Inside testSalutationMessage()
Hi!Manisha

Suite1
Total tests run: 3, Failures: 0, Skips: 0
```

dependsOnGroups Vs dependsOnMethods

- On using groups, we are no longer exposed to refactoring problems. as long as we don't modify the dependsOnGroups or groups attributes, our tests will keep running with the proper dependencies set up.
- Whenever a new method needs to be added in the dependency graph, all we need to do is put it in the right group and make sure it depends on the correct group. We don't need to modify any other method.

PARAMETERIZED TEST

Another interesting feature available in TestNG is *parametric testing*. In most cases, you'll come across a scenario where the business logic requires a hugely varying number of tests.

Parameterized tests allow developer to run the same test over and over again using different values.

TestNG lets you pass parameters directly to your test methods in two different ways: With

- testng.xml
- With Data Providers

Passing Parameters with testng.xml

With this technique you define the simple parameters in the *testng.xml* file and then reference those parameters in source files. Let us see an example below on how to use this technique to pas parameters.

S

Create Test Case Class

Create a java test class say ParameterizedTest1.java.

- Add test method parameterTest to your test class. This method takes a String as input parameter.
- Add the annotation @Parameters"myName" to this method. The parameter would be passed values from testing.xml which we will see in the next step.

Create the java class file name ParameterizedTest1.java in C:\ > TestNG_WORKSPACE

```
import org. testng. annotations. Parameters; import
org. testng. annotations. Test;
```

```
public class ParameterizedTest1 { @Test
    @Parameters("myName")
    public void parameterTest(String myName) {
        System. out. println("Parameterized value is : " + myName);
    }
}
```

Create testng.xml

Create a testing.xml C:\ > TestNG_WORKSPACE to execute Test cases.

We can also define the parameters at the <suite> level. Suppose we have defined myName at both <suite> and <test>, levels then, in such cases regular scoping rules apply. This means that any class inside <test> tag will see the value of parameter defined in <test>, while the classes in the rest of the testng.xml file will see the value defined in <suite>.

Compile the Test case class using javac.

```
C:\textra{C:\textra{VORKSPACE}} javac ParameterizedTest1. java
```

Now, run the testng.xml, which will run the *parameterTest* method. TestNG will try to find a parameter named *myName* first in the <test> tag , and then, if it can't find it, it searches in the <suit> tag that encloses it.

```
C:\forall TestNG_WORKSPACE\forall java -cp "C:\forall TestNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output.

TestNG will automatically try to convert the value specified in testng.xml to the type of your parameter. Here are the types supported:

- String
- int/Integer
- boolean/Boolean byte/Byte
- char/Character
- double/Double

•

- float/Float long/Long
- short/Short

Passing Parameters with Dataproviders

When you need to pass complex parameters or parameters that need to be created from Java complex objects, objects read from a property file or a database, etc..., in such cases parameters can be passed using Dataproviders. A Data Provider is a method annotated with @DataProvider. This annotation has only one string attribute: its name. If the name is not supplied, the Data Provider's name automatically defaults to the method's name. A Data Provider returns an array of objects.

Let us check out examples below of using Dataproviders. The first example is about @DataProvider using Vector, String or Integer as parameter and the second example is about @DataProvider using object as parameter

Example 1

Here, the @DataProvider passes Integer and Boolean as parameter.

Create Java class

Create a java class PrimeNumberChecker.java. This class checks if the number is prime. Create this class in C:\ > TestNG WORKSPACE

```
public class PrimeNumberChecker {
   public Boolean validate(final Integer primeNumber) { for (int i =
        2; i < (primeNumber / 2); i++) {
        if (primeNumber % i == 0) { return
            false;
        }
   }
   return true;
}</pre>
```

Create Test Case Class

- Create a java test class say ParamTestWithDataProvider1.java.
- Define the method primeNumbers which is defined as a Dataprovider using the annotation. This method returns array of object array.
- Add test method testPrimeNumberChecker to your test class. This method takes a Integer and Boolean as input parameters. This method validates if the parameter passed is a prime number.
- Add the annotation @TestdataProvider = "test1" to this method. The attribute dataProvider is mapped to "test1".

Create the java class file name ParamTestWithDataProvider1.java in C:\ > TestNG_WORKSPACE

```
import org. testng. Assert;
import org. testng. annotations. BeforeMethod; import
org. testng. annotations. DataProvider; import
org. testng. annotations. Test;

public class ParamTestWithDataProvider1 {
    private PrimeNumberChecker primeNumberChecker;

    @BeforeMethod
    public void initialize() {
```

Create testng.xml

Create a testng.xml C:\ > TestNG_WORKSPACE to execute Test cases.

Compile the Test case class using javac.

```
C:\forall TestNG_WORKSPACE>. javac ParamTestWithDataProvider1. java PrimeNumberChecker. java
```

Now, run the testng.xml.

```
C:\forestNG_WORKSPACE>java -cp "C:\forestNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output.

Example 2

Here, the @DataProvider passes Object as parameter.

Create Java class

Create a java class Bean.java, which is simple object with get/set methods, in C:\ > TestNG_WORKSPACE.

public class Bean {	

```
private String val;
private int i:
public Bean(String val, int i) {
    this.val=val;
    this.i=i;
}
public String getVal() {
return val;
}
public void setVal(String val) { this.val}
= val;
}
public int getI() {
return i;
}
public void setI(int i) { this.i}
= i;
}
```

Create Test Case Class

Create a java test class say ParamTestWithDataProvider2.java.

Define the method primeNumbers which is defined as a Dataprovider using the annotation. This method returns array of object array.

Add test method testMethod to your test class. This method takes object bean as parameter.

Add the annotation @*TestdataProvider* = "*test1*" to this method. The attribute dataProvider is mapped to "test1".

Create the java class file name ParamTestWithDataProvider2.java in C:\ > TestNG_WORKSPACE

Create testng.xml

Create a testing.xml C:\ > TestNG_WORKSPACE to execute Test cases.

Compile the Test case class using javac.

C:\textractions C:\textractions C:\textractions C:\textractions C:\textraction C:	
•	
•	
•	
•	

Now, run the testng.xml.

```
C:\forall TestNG_WORKSPACE\forall java -cp "C:\forall TestNG_WORKSPACE" org. testng. TestNG testng. xml
```

Verify the output.

RUN JUNIT TESTS

Now that you have understood TestNG and its various tests, you must be worried by now as to how to refactor your existing Junit code. There's no need to worry as TestNG provides a way to shift from Junit to TestNG at your own pace. You can execute your existing Junit test cases using TestNG.

TestNG can automatically recognize and run JUnit tests, so you can use TestNG as a runner for all your existing tests and write new tests using TestNG. All you have to do is to put JUnit library on the TestNG classpath, so it can find and use JUnit classes, change your test runner from JUnit to TestNG in Ant and then run TestNG in "mixed" mode. This way you can have all your tests in the same project, even in the same package, and start using TestNG. This approach also allows you to convert your existing JUnittests to TestNG incrementally.

Let us see an example below and try out the above feature:

Create Junit Test case Class

Create a java class which is a Junit test class, TestJunit.java in C:\ > TestNG_WORKSPACE

```
import org. junit. Test;
import static org. testng. AssertJUnit. assertEquals;

public class TestJunit { @
    Test
    public void testAdd() {
        String str= "Junit testing using TestNG"; assertEquals("Junit testing usingTestNG", str);
    }
}
```

Now, let's write the testng.xml in C:\ > TestNG_WORKSPACE which would contain the <suite> tag as follows:

To execute the Junit test cases define property *junit="true"* as in the xml above. The Junit test case class TestJunit is defined in class name.

For Junit 4, TestNG will use the org.junit.runner.JUnitCore runner to run your tests. Compile

all java classes using javac.

C:\footnote{C:\footnote{TestJunit.java}

Now, run the testng.xml, which will run Junit test case as TestNG.

C:\forall C:\forall TestNG_WORKSPACE\java -cp "C:\forall TestNG_WORKSPACE:C:\forall TestNG_WORKSPACE\forall lib\forall junit- 4.11. jar" org. testng. TestNG testng. xml

Here I've placed the junit-4.11.jar under C:\TestNG_WORKSPACE\lib\junit-4.11.jar. Verify the

output.

Converted JUnit suite

Total tests run: 1, Failures: 0, Skips: 0

TEST RESULTS

Reporting is the most important part of any test execution, reason being it helps the user to understand the result of the test execution, point of failure, and reasons for the failure. Logging, on the other hand, is important to keep an eye on the execution flow or for debugging in case of any failures.

TestNG by default generates a different type of report for its test execution. This includes an HTML and an XML report output. TestNG also allows its users to write their own reporter and use it with TestNG. There is also an option to write your own loggers, which are notified at runtime by TestNG.

There are two main ways to generate a report with TestNG:

Listeners: For implementing a listener class, the class has to implement the org.testng.ITestListener
 interface. These classes are notified at runtime by TestNG when the test starts, finishes, fails, skips, or passes.

Reporters: For implementing a reporting class, the class has to implement an *org.testng.IReporter*interface. These classes are called when the whole suite run ends. The object containing the information of the whole test run is passed to this class when called.

The table below lists examples for different cases of reporting and logging:

<u>Custom Logging</u> This example illustrates how to write your own logger. <u>Custom</u>

Reporter This example illustrates how to write your own reporter.

HTML and XML This example illustrates the default HTML and XML report generated by report

TestNG.

<u>JUnit Reports</u> This example illustrates the about generating Junit reports from TestNG reports.

PLUG WITH ANT

In this example, we will demonstrate how to run TestNG using ANT. Let's follow the given steps:

Step 1: Download Apache Ant

Download Apache Ant

os

Archive name

Windows apache-ant-1.8.4-bin.zip Linux apache-ant-1.8.4-bin.tar.gz

Mac apache-ant-1.8.4-bin.tar.gz

Step 2: Set Ant Environment

Set the **ANT_HOME** environment variable to point to the base directory location where ANT libraries is stored on your machine. For example, We've stored Ant libraries in apache-ant-1.8.4 folder on various Operating Systems as follows.

os	Output
Windows	Set the environment variable ANT_HOME to C:\Program Files\Apache Software Foundation\apache-ant-1.8.4
Linux	export ANT_HOME=/usr/local/\apache-ant-1.8.4
Mac	export ANT_HOME=/Library/\apache-ant-1.8.4

Append Ant compiler location to System Path is as follows for different OS:

os	Output
Windows	Append the string; %ANT_HOME\bin to the end of the system variable, Path. Linux
	export PATH=PATH:ANT_HOME/bin/
Mac	not required

Step 3: Download TestNG Archive

Download http://www.testng.org.

os	Archive name
Windows	testng-6.8.jar
Linux	testng-6.8.jar
Mac	testng-6.8.jar

Step 4: Create Project Structure

- Create folder TestNGWithAnt in C:\ > TestNG_WORKSPACE
- Create folder src in C:\ > TestNG_WORKSPACE > TestNGWithAnt Create
- folder test in C:\ > TestNG_WORKSPACE > TestNGWithAnt Create folder lib
- in C:\ > TestNG_WORKSPACE > TestNGWithAnt
- Create MessageUtil class in C:\ > TestNG_WORKSPACE > TestNGWithAnt > src folder

/*

* This class prints the given message on console.

*/

```
public class MessageUtil { private

String message:

//Constructor
//@ param message to be printed public
MessageUtil(Stringmessage) {
    this.message = message:
}

// prints the message public
void printMessage() {
    System.out.println(message): return
    message:
}

// add "Hi!" to the message public
String salutationMessage() {
    message = "Hi!" + message:
    System.out.println(message): return
    message:
}
```

Create TestMessageUtil class in C:\ > TestNG_WORKSPACE > TestNGWithAnt > src folder

Copy testng-6.8.jar in C:\ > TestNG_WORKSPACE > TestNGWithAnt > lib folder

Create ANT build.xml

First we need define the TestNG ant task as follows:

Then, we'll be using **<testng>** task in Ant to execute our TestNG test cases.

The C:\ > TestNG_WORKSPACE > TestNGWithAnt >\ build.xml is as follows:

<pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>	pasedir=".">	
•		
_		
•		

```
<taskdef name="testng" classname="org. testng. TestNGAntTask">
    <classpath>
       <pathelement location="lib/testng-6.8.jar"/>
    </classpath>
  </taskdef>
   cproperty name="testdir" location="test" />
   property name="srcdir" location="src"/>
   cproperty name="libdir" location="lib" />
   cproperty name="full-compile" value="true" />
   <path />
   <path >
        <fileset dir="${libdir}">
           <include name="**/*. jar" />
       </fileset>
       <pathelement location="${testdir}" />
       <pathelement location="${srcdir}" />
       <path ref />
   </path>
   <target name="clean" >
       <delete verbose="${full-compile}">
           <fileset dir="${testdir}" includes="**/*.class" />
       </delete>
   </target>
   <target name="compile" depends="clean">
       <javac srcdir="${srcdir}" destdir="${testdir}"</pre>
           verbose="$ {full-compile}">
           <classpath ref/>
       </iavac>
   </target>
   <target name="test" depends="compile">
 <testng outputdir="${testdir}" classpathref="classpath.test">
       <xmlfileset dir="${srcdir}" includes="testng.xml"/>
    </testng>
   </target>
</project>
```

Run the following ant command.

C:\forall TestNG_WORKSPACE\forall TestNGWithAnt\rangle ant

Verify the output.

	-
To set up TestNG with eclipse, the following steps need to be followed.	
Step 1: Download TestNG archive	

os	Archive name
Windows	testng-6.8.jar
Linux	testng-6.8.jar
Mac	testng-6.8.jar

Assume you copied above JAR file in C:\>TestNG folder.

Step 2: Set Eclipse environment

• Open eclipse -> right click on project and click on property > Build Path > Configure Build Path and add the testng-6.8.jar in the libraries using *Add External Jar* button.

- We assume that your eclipse has inbuilt TestNG plugin if it is not available then please get the latest version using the update site:
 - In your eclipse IDE select Help/ Software updates / Find and Install. Search for
 - new features toinstall.
 - New remote site.
 - For Eclipse 3.4 and above, enter http://beust.com/eclipse. For
 - Eclipse 3.3 and below, enter http://beust.com/eclipse1.
 - Make sure the check boxnext to URL is checked and click Next. Eclipse
 - will then guide you through the process.

Now, your eclipse is ready for the development of TestNG test cases.

Step 3: Verify TestNG installation in Eclipse Create a project

TestNGProject in eclipse at any location. Create a class

MessageUtil to test in the project.

```
/*
 * This class prints the given message on console.
 */
public class MessageUtil { private

    String message;

    //Constructor
    //@ param message to be printed public
    MessageUtil(Stringmessage) {
        this. message = message;
    }

    // prints the message
    public String printMessage() {
        System. out. println(message); return
        message;
    }
}
```

Create a test class TestNGExample in the project.

```
import org.testng.Assert;
import org.testng.annotations.Test;

public class TestNGExample {
    String message = "Hello World";
    MessageUtil messageUtil = new MessageUtil(message);

    @Test
    public void testPrintMessage() {
        Assert.assertEquals(message, messageUtil.printMessage());
    }
}
```

•
